PS Claim 1; Page 57-62; 133pp; English.

CC cDNAs (702946-49) coding for 4 novel human EPH-like receptor protein

CC tyrosine kinases, HEKS, HEKF, HEKB and HEK11 (R85089-92), respectively,

CC were isolated from a human foetal brain cDNA library using a directed

CC Reproach with primers (see T02960-61) based on conserved regions of

CC receptor PTKs and EPH-like receptor PTKS. HEKF, HEKF, HEKF, and HEKB show

CC extensive homology to the catalytic domain of chicken EPH-like

CC receptors CekF, Cek7 and Cek8. HEK11 shows no homology to any known

CC EPH-like receptor. The isolated cDNAs are used for prodn. of

CC recombinant HEKS and chimeric receptors, in hybridisation assays, and

CC detect abnormalities in HEK receptor genes.

C DNA probes based on protein tyrosine-kinase (pTK) sequences were used to screen cDNA libraries to identify novel pTK genes. The bpTKs, bpTK1, bpTK2, bpTK3, bpTK4, bpTK5 and bpTK7 (R8924-28 and R85935, respectively) are expressed in human brain tissue and show homology to known pTKs. A full-length sequence for the bpTK7 gene (T03100) was obtd. This gene may be used to design new drugs, peptides and antisense constructs that modulate pTK activity.

The present invention describes nucleic acid molecules for ror-1, ror-2, ehk-1 and ehk-2. And ebk-2 the proteins are orphan receptor tyrosine kinases. The present sequence encodes rat Ehk-2. Sequence 3592 BP; 946 A; 916 C; 894 G; 834 T;

                                                                                                                                                          The present invention describes nucleic acid molecules for ror-1 ror-2, ehk-1 and ehk-2. Also described are the corresponding pro Ror-1; Ror-2; Ehk-1; and Ehk-2. The proteins are orphan receptor tyrosine kinases. The present sequence encodes rat Ehk-1. A cDNA clone (T18893) codes for rat REK7 (R97853), an eph-related tyrosine kinase receptor, for which AL-1 (see also w97854) is a ligand. It was isolated using degenerate receptor tyrosine kinase primers (T18894-96) to amplify cDNAs of an adult mouse hippocampal cDNA library. A PCR fragment was used as a probe to isolate the full-length REK7 cDNA from a rat hippocampal LDNA library. An REK-1gg fusion was used to screen cultured cell lines for surface expression of REK7-binding activity. Primers based on isolated ligands were used to amplify human breast carcinoma BT20 cell cDNA, and an amplified fragment was used to screen a human foetal brain cDNA library, leading to the isolation of AL-1 CDNA (T18897). PS Claim 2; Fig 2; 72pp; English.

CC The present sequence encodes mouse Bsk, which is a receptor-like

CC Typosine kinase. The nucleic acid sequence encoding Bsk can be used in

CC typosine kinase. The nucleic acid sequence encoding Bsk can be used in

CC trom a manmal selected with a disease, such as neurodegenerative

CC diseases or disorders and neoplasms. The nucleic acid sequence can also

CC be delivered into the limbic system of patients with limbic system

CC neurodegenerative disease, disorder or injury, to promote or enhance

CC diseases include, chromosomal abnormalities, degenerative growth and

CC development disorders, viral infections, bacterial infections, brain

CC injuries, neoplastic conditions, Alzheimer's disease, epilepsy,

CC schizophrenia, or stroke and cerebral ischaemia.

CDNAS (T02946-49) coding for 4 novel human EPH-like receptor protein tyrosine kinases, HEK5, HEK7, HEK8 and HEK11 (R85089-92), respectively, were isolated from a human foetal brain cDNA library using a directed PCR approach with primers (see T02960-61) based on conserved regions of receptor PTKs and EPH-like receptor PTKs. HEK5, HEK7 and HEK8 show extensive homology to the catalytic domain of chicken EPH-like receptor. The isolated cDNAs are used for prodn. of recombinant HEKs and chimeric receptors, in hybridisation assays, and to detect abnormalities in HEK receptor genes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PCR approach with primers (see T02960-61) based on conserved regions receptor PTKs and EPH-like receptor PTKS. HEK5, HEK7 and HEK8 show extensive homology to the catalytic domain of chicken EPH-like receptors Cek5, Cek7 and Cek8. HEK11 shows no homology to any known EPH-like receptor. The isolated cDNAs are used for prodn. of recombinant HEKs and chimeric receptors, in hybridisation assays, and to detect abnormalities in HEK receptor genes.

Example 1: Page 115-116; 128pp; English.

CDNA cloning using adult mouse brains and Northern blotting identified 2 clones, MDK1 T1 (T32961) and MDK1 T2 (T32962), that coded for truncated versions (W03422 and W03423; respectively) of the novel mouse developmental kinase 1 (MDK1) (see also T32960), a new member of the eck/eph family of receptor tyrosine kinases.

MDK T1 and T2 each possess the entire ectodomain, the transmembrane domain and part of the juxtamembrane region of MDK1 (see also W03421), but lack the catalytic tyrosine kinase domain. They may have a modulatory function. The cDNA clones can be used to produce MDK1

T1 and T2, which are useful for screening potential agents for treatment of diseases characterised by abnormal signal transduction. Sequence 2323 BP; 680 A; 497 C; 609 G; 537 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              diagnosis and treatment

Example 1; Page 111-12; 128pp; English.

CDNA cloning using adult mouse brains and Northern blotting identified 2 clones, MDK1 T1 (T32961) and MDK1 T2 (T32962), that coded for truncated versions (W03422 and W03423, respectively) of the novel mouse developmental kinase 1 (MDK1) (see also T32960), a new member of the eck/eph family of receptor tyrosine kinases.

MDK T1 and T2 each possess the entire ectodomain, the transmembrane domain and part of the juxtamembrane region of MDK1 (see also W03421), but lack the catalytic tyrosine kinase domain. They may have a modulatory function. The cDNA clones can be used to produce MDK1 T1 and T2, which are useful for screening potential agents for treatment of diseases characterised by abnormal signal transduction. An amplified fragment was used to screen an 11.5-day-old mouse embryo and an adult mouse brain CDNA library to obtain the MDK1 clone. 4 Sequence variants (see also W03422-25) of MDK1 were also identified. MDK1 nucleic acids can be used for the recombinant prodn. of MDK1, as probes to detect MDK1, and for the gene therapy of diseases involving abnormalities in signal transduction, such as neurodegenerative and neuroproliferative disorders and cancer.

The variants may originate via alternative splicing of the same gene. Cek7 had the lowest level of expression of 7 novel Eph-related kinases examined and was barely detectable in adult tissues.

The variants may originate via alternative splicing of the same gene. Cek7 had the lowest level of expression of 7 novel Eph-related kinases examined and was barely detectable in adult tissues.
